FORWARD DEPLOYED · PLATFORM & AI · UNITED STATES

Austin *Arlint*

Forward-deployed engineer building paved-road platforms, shift-left DevSecOps, and agentic AI tooling for teams that have to ship — fast, secure, and under audit.

austin@arlint.dev • arlint.dev • Active Secret Clearance • Hourly rates upon request

01 — SUMMARY

Forward-deployed engineer and AI leader for federal Zero-Trust and DevSecOps work — embedded with teams, shipping the platforms, security tooling, and agentic AI that turn regulated work into something a small team can actually move.

I work at the seam of three disciplines that have stopped being separate. On the AI side, I set direction and ship the engineering — MCP servers, RAG pipelines, agent workflows, and the evaluation harness that anchors model behavior in regulated environments, with a bias toward self-hosted and open-source models that respect data boundaries. On the DevSecOps side, I run the network-intelligence and compliance backbone of a Zero-Trust cloud-access platform for DoD mission partners — Palo Alto, Appgate SDP, Transit Gateway, OpenSearch — with policy-as-code guardrails, SBOM and supply-chain scanning, and STIG/RMF automation woven into CI/CD so compliance falls out of the build rather than living in a spreadsheet. On the platform side, I build the paved roads underneath both — Kubernetes on EKS, Terraform modules, GitOps pipelines, and developer-experience tooling that turns ad-hoc operations into a product engineers can self-serve. I embed deep, take ownership end-to-end, and treat platform, security posture, and AI as one practice.

SHE BASH LLC

Chief AI Officer · Senior Software Engineer

AI leader at a federal DevSecOps practice — set the firm's AI direction and ship the engineering work behind it. Focus on agentic systems that respect data boundaries, self-hosted and open-source models, and AI tooling that wraps the Zero-Trust and DevSecOps work the firm is already known for.

- § Set the firm's AI direction: opinionated on self-hosted and open-source models, deterministic evaluations, and agent traces that survive an audit — the AI strategy a regulated client can actually adopt
- § Architect and ship the AI layer end-to-end — MCP servers, RAG pipelines over operational and security corpora, and agent workflows that turn DevSecOps telemetry into a conversational surface for engineers and operators
- § Build the platform underneath the AI: model gateways, evaluation harnesses, agent observability, and the developer-experience scaffolding that lets a small team move fast without losing trust in what the model is doing
- § Translate AI capability into the firm's existing practice areas — Zero-Trust, ICAM, PKI, cloud-native infrastructure — so the AI work compounds the security posture rather than fighting it

Raft

Senior DevSecOps Engineer

Senior engineer on CNAP, a zero-trust cloud-access platform in AWS GovCloud serving DoD mission partners. Own the network-intelligence layer, the paved-road platform engineers build on, and the AI-native tooling that's starting to wrap the whole thing.

§ Designed and shipped the executive network-intelligence pipeline that fuses Palo Alto traffic, Appgate SDP zero-trust tunnels, and AWS Transit Gateway routing — turning 460+ firewall rules and millions of log events into per-customer markdown reports, Mermaid traffic-flow diagrams, and audit-ready CSV evidence with a defensible Compliant → High-Risk classification

§ Operates the multi-firewall border architecture across regions: per-firewall report folders, customer-pattern matching, and live CIDR-to-customer mapping driven from AWS TGW route tables

§ Built the OpenSearch query layer (cnap_palo_traffic, cnap_appgate, cloudtrail-production) on AWS SigV4 + assumed roles, powering investigations, dashboards, and continuous-control evidence — turning detection telemetry into a queryable platform primitive

§ Wove STIG/RMF compliance into CI/CD — SBOM generation, container scanning, policy-as-code guardrails, evidence bundling, and an interactive checklist server with SQLite state — so compliance falls out of the build instead of living in a spreadsheet

§ Operates the paved-road platform: EKS workloads, Terraform modules, GitOps-driven deployment pipelines, secrets management, and developer-experience tooling that lets feature teams self-serve provisioning without leaving the compliance perimeter

§ Building the AI-native layer: MCP servers and agent workflows that put live telemetry, audit evidence, and runbook context one prompt away — turning security operations into a conversational interface for the team

Patrick Joyce — *AWS sherpa · CNAP wingman*

SAME GOVERNMENT PROGRAM (CNAP), DIFFERENT EMPLOYER

Will tell you he just guessed the answer, then explain exactly which subnet your VPC endpoint should be in. Taught me firelens, fluentbit-on-ECS, and the discipline of using FQDNs instead of IPs that change monthly. Once killed the prod EKS management cluster on a quiet afternoon and saved the government ~$10k a month — nobody noticed because nobody needed it. The teammate I should listen to more often.

For the unfiltered CNAP roster (beards, hot dogs, Costco runs, and all), see ***cnapmisfits.arlint.dev***

APR 2019 – DEC 2023

Teltow, Germany → Missoula, MT (Remote)

NTT

Senior Software Engineer · Senior Developer

Almost five years on NTT's in-house Automation Platform — a Kubernetes-native control plane that turned manual datacenter and cloud operations into a self-service product for engineering teams. Started in Berlin during the Dimension Data → NTT integration, finished remote from Montana.

- § Senior developer on the Automation Platform: a Kubernetes-native control plane built on Rancher, Knative, Helm, and custom operators that turned ad-hoc ops into golden paths internal teams could self-serve
- § Owned the Django + Vue.js control surface engineers used daily — backend APIs, feature work, and the operator-facing UX that made the platform feel like a product, not a CLI
- § Shipped deployment, configuration, and orchestration capabilities in lockstep with the Kubernetes / Helm primitives underneath, including custom operators where stock tooling fell short
- § Bridged the Dimension Data → NTT acquisition: same product, same team, new corporate plumbing — kept the platform moving through the integration
- § Continued remotely from Montana after the EU → US transition, leading platform work for North American teams

---

`Kubernetes` `Rancher` `Knative` `Helm` `Python` `Django` `Vue.js` `Ansible`

OCT 2016 – APR 2019

Dimension Data · *DevOps Engineer L2*
Teltow, Germany

Built datacenter deployment and operations automation across a 1500+ server estate — Ansible playbooks, Jenkins pipelines, and custom Python / Vue / Node tooling, with PowerBI compliance auditing layered on top. Joined the NTT family via the 2019 acquisition.

AUG 2015 – OCT 2016

Helpling · *System Administrator*
Berlin, Germany

Ran end-to-end systems for a fast-growing marketplace startup — Google Workspace, VoIP telephony, L2/L3 networking, Jira/Confluence, helpdesk, and self-service wiki. First role in Germany.

AUG 2013 – JUL 2015

Control4 · *System Administrator*
Draper, UT

Windows Server / Active Directory, Cisco networking, SharePoint, Office 365, and the VMware estate for a home-automation OEM. First job out of university.

OCT 2011 – FEB 2013

RR Donnelley · *Programmer*
Logan, UT

Built and maintained custom software for high-value print and publishing projects — Perl, XML control files, in-house tooling — and worked directly with production, project managers, sales, and clients to keep deliveries on spec.

MAY 2011 – AUG 2011

Goldman Sachs · *New Analyst Intern*
Salt Lake City, UT

Summer analyst supporting four SLC corporate sites — network patching, switch/router replacements, hardware repairs, OS deployments via PXE/deployment servers, and custom tooling for technician workflow management.

JAN 2009 – OCT 2011

Space Dynamics Laboratory · *Assistant Network Administrator*
Logan, UT

Software distribution, license auditing, and account management for a USU research lab — SCCM, SQL reporting, and silent-installer engineering that let IT push software without interrupting researchers. First IT role, alongside undergrad.

03 — CAPABILITIES

Platform engineering, DevSecOps, and agentic AI — one practice, five surfaces.

Platform Engineering

Paved roads & golden paths, platform-as-a-product

Internal developer platforms (IDPs) and DevEx tooling

Kubernetes — EKS, Rancher, self-managed

Terraform modules, remote state, GovCloud providers

GitOps — ArgoCD / Flux, declarative delivery

OpenTelemetry, Grafana, Prometheus, CloudWatch

SRE practice — SLOs, runbooks, incident review

DevSecOps & Zero Trust

Shift-left security in CI/CD pipelines

Supply-chain security — SBOM, signing, attestations

Policy-as-code — OPA / Rego, admission control

Container & image scanning — Trivy, runtime telemetry

Zero-trust network access — Appgate SDP, microsegmentation

Palo Alto Panorama, NGFW, App-ID, traffic analytics

STIG / RMF / DISA SCAP, continuous control monitoring

Secrets management, IAM least privilege, SigV4

AI & Agentic Systems

Anthropic Claude API, Claude Code, Claude Agent SDK

Model Context Protocol (MCP) server development

Agentic workflows & tool-use orchestration

RAG pipelines, embeddings, vector search

Local LLMs — Ollama, Gemma, on-prem inference

Prompt engineering, evals, agent observability

Knowledge-graph construction over unstructured corpora

Cloud Infrastructure

AWS — GovCloud + Commercial, multi-account / Organizations

EC2, EKS, RDS, S3, Route 53, IAM, KMS, Lambda

AWS Transit Gateway, VPC, Direct Connect, PrivateLink

Azure — AKS, App Services, Azure DevOps

OpenSearch / Elasticsearch — queries, dashboards, ingest

Ansible — playbooks, roles, dynamic inventory

Languages & Build

Python — boto3, opensearch-py, data pipelines, automation

TypeScript / JavaScript — Node.js, React, Svelte, Vue

Go — CLI tools and services

Bash, PowerShell, shell-driven automation

SQL, SQLite, PostgreSQL

GitHub Actions, Jenkins, GitLab CI, Bun / Vite

04 — SELECTED PROJECTS

Things I built, mostly nights and weekends — agents, platforms, and the tooling around them.

Hours — SOURCE

Native macOS time tracking + invoicing with MCP integration

End-to-end time tracking and invoicing app with a Claude-native MCP server — start/stop timers, generate PDF invoices, and manage clients/contracts/quotes directly from a conversational interface.

`Swift` `Node.js` `MCP` `SQLite` `PDF`

Hours MCP Server — SOURCE

Conversational time tracking for Claude Desktop

Standalone MCP server exposing 60+ tools for time tracking, billing cycles, invoice generation, and client management — drives the Hours app from Claude with 15-minute precision.

`TypeScript` `MCP` `Node.js`

HomeGuard — SOURCE

Private AI summaries over mirrored device traffic

Self-hosted dashboard that ingests mirrored WhatsApp activity, runs local LLM summarization with Ollama/Gemma, surfaces concerning topics, and lets an investigator chat with a knowledge graph built from the corpus.

`Ollama` `Gemma` `Node.js` `Knowledge Graph`

Slack Impersonator — SOURCE

Voice-cloning Slack bot with approval workflow

Slack bot that learns a user's voice from history and replies on their behalf. Vue admin UI with persona library, A/B experiments, draft approval flow, and MPIM polling.

`Vue` `Node.js` `Slack API` `LLM`

Trivy Glass — SOURCE

Vulnerability visualizer for Kubernetes

Web UI that visualizes container vulnerabilities discovered by the Trivy Operator on Kubernetes clusters — real-time scanning, interactive dashboards, severity drilldowns.

`Svelte` `Node.js` `Kubernetes` `Trivy`

Switchboard — SOURCE

Desktop app for browsing CLI coding sessions

Desktop client for browsing, searching, and managing transcripts from CLI-driven coding sessions across multiple projects.

`Electron` `TypeScript` `React`
